

Language detection is the single point of failure for Uzbek

ElevenLabs Scribe v2, AUTO condition · Phase 3A evaluation split · not a benchmark of detection per se, but a measured driver of WER

A · Detection accuracy (AUTO)

B · What Uzbek is mistaken for (n = 51 misdetections) · C · WER cost of a wrong detection (Uzbek)

Detection accuracy is computed from provider_detected_language in frozen Phase 3A records. The single Kazakh misdetection (1 of 90) was Ukrainian. Cyrillic-script detections of Uzbek produce wrong-script output (WER ≥ 1.0) — see Error Analysis.
