

R1 routing vs always-HINT (PRIMARY hypothesis): routing shows no advantage over always-HINT

ElevenLabs Scribe v2 · Phase 3A evaluation split · R1 routes to HINT when AUTO misdetects the language · success criterion: $\text{mean}(d) \leq -0.030$ AND $p < 0.05$ — NOT MET

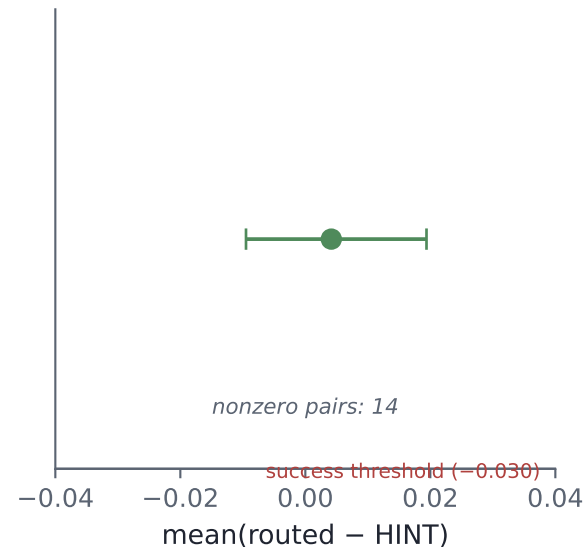

A · Mean WER by condition

B · Uzbek · $\Delta = -0.0043$, $p = 0.642$

C · Kazakh · $\Delta = +0.0042$, $p = 0.755$

Routing converges toward HINT because it already routes most Uzbek utterances to HINT (73% Uzbek, 1% Kazakh). Routed $\approx$ HINT everywhere; the pre-specified PRIMARY success criterion is not met for any population. Do not interpret routed-vs-AUTO gains as evidence that routing beats always-HINT.
